Database Programming with SQL

16-1

Working With Sequences

ORACLE
Academy

Objectives

- This lesson covers the following objectives:
  - List at least three useful characteristics of a sequence
  - Write and execute a SQL statement that creates a sequence
  - Query the data dictionary using USER_SEQUENCES to confirm a sequence definition
  - Apply the rules for using NEXTVAL to generate sequential unique numbers in a table
  - List the advantages and disadvantages of caching sequence values
  - Name three reasons why gaps can occur in a sequence

ORACLE
Academy

DP 16-1
Working With Sequences

3

Purpose

- Can you image how tedious it would be to have to enter the names of the 30,000 people who enter the London Marathon into a database, while making sure that no one was given the same identification number?

- What if you went to lunch and when you returned, someone else had entered some of the runners' applications?

- How would you know where to start again?

Purpose

- Fortunately, SQL has a process for automatically generating unique numbers that eliminates the worry about the details of duplicate numbers

- The numbering process is handled through a database object called a SEQUENCE

ORACLE
Academy

DP 16-1
Working With Sequences

5

The Sequence Object

- You already know how to create two kinds of database objects, the TABLE and the VIEW
- A third database object is the SEQUENCE
- A SEQUENCE is a shareable object used to automatically generate unique numbers
- Because it is a shareable object, multiple users can access it
- Typically, sequences are used to create a primary-key value

6

The Sequence Object

- As you'll recall, primary keys must be unique for each row. The sequence is generated and incremented (or decremented) by an internal Oracle routine

- This object is a time-saver for you because it reduces the amount of code you need to write

7
The Sequence Object

- Sequence numbers are stored and generated independently of tables
- Therefore, the same sequence can be used for multiple tables
- To create a SEQUENCE:

```
CREATE SEQUENCE sequence
       [INCREMENT BY n]
       [START WITH n]
       [{MAXVALUE n | NOMAXVALUE}]
       [{MINVALUE n | NOMINVALUE}]
       [{CYCLE | NOCYCLE}]
       [{CACHE n | NOCACHE}];
```

ORACLE
Academy

DP 16-1
Working With Sequences

8

Although a sequence can be used for multiple tables, this is not recommended, as each number in the sequence is used only once, each table will have missing values (the ones used by the other tables).

Sequence Syntax

```
CREATE SEQUENCE sequence
       [INCREMENT BY n]
       [START WITH n]
       [{MAXVALUE n | NOMAXVALUE}]
       [{MINVALUE n | NOMINVALUE}]
       [{CYCLE | NOCYCLE}]
       [{CACHE n | NOCACHE}];
```

sequence	is the name of the sequence generator (object)
INCREMENT BY n	specifies the interval between sequence numbers where n is an integer (If this clause is omitted, the sequence increments by 1.)
START WITH n	specifies the first sequence number to be generated (If this clause is omitted, the sequence starts with 1.)

ORACLE
Academy

The name of the sequence must be included in the CREATE SEQUENCE statement, all other clauses are optional, but it is recommended to include all clauses.

Sequence Syntax

```
CREATE SEQUENCE sequence
        [INCREMENT BY n]
        [START WITH n]
        [{MAXVALUE n | NOMAXVALUE}]
        [{MINVALUE n | NOMINVALUE}]
        [{CYCLE | NOCYCLE}]
        [{CACHE n | NOCACHE}];
```

MAXVALUE n	specifies the maximum value the sequence can generate
NOMAXVALUE	specifies a maximum value of 10^27 for an ascending sequence and -1 for a descending sequence (default)
MINVALUE n	specifies the minimum sequence value

MINVAUE would be used for a descending sequence.

Sequence Syntax

```
CREATE SEQUENCE sequence
      [INCREMENT BY n]
      [START WITH n]
      [{MAXVALUE n | NOMAXVALUE}]
      [{MINVALUE n | NOMINVALUE}]
      [{CYCLE | NOCYCLE}]
      [{CACHE n | NOCACHE}];
```

NOMINVALUE	specifies a minimum value of 1 for an ascending sequence and $-(10^{26})$ for a descending sequence (default)
CYCLE | NOCYCLE	specifies whether the sequence continues to generate values after reaching its maximum or minimum value (NOCYCLE is the default option.)

ORACLE
Academy

DP 16-1
Working With Sequences

11

Sequence Syntax

```
CREATE SEQUENCE sequence
       [INCREMENT BY n]
       [START WITH n]
       [{MAXVALUE n | NOMAXVALUE}]
       [{MINVALUE n | NOMINVALUE}]
       [{CYCLE | NOCYCLE}]
       [{CACHE n | NOCACHE}];
```

CACHE n | NOCACHE	specifies how many values the Oracle server pre-allocates and keeps in memory. (By default, the Oracle server caches 20 values.) If the system crashes, the values are lost.

Creating a Sequence

- In the SEQUENCE created for the London Marathon runners, the numbers will increment by 1, starting with the number 1

- In this case, beginning the sequence with 1 is probably the best starting point

```
CREATE SEQUENCE runner_id_seq
  INCREMENT BY 1
  START WITH 1
  MAXVALUE 50000
  NOCACHE
  NOCYCLE;
```

ORACLE
Academy

13

Creating a Sequence

- It is a tradition that the best runner in the elite group wears number 1

- For other situations, such as department IDs and employee IDs, the starting number may be assigned differently

- Because there will be at least 30,000 runners, the sequence's maximum value was set well above the expected number of runners

```
CREATE SEQUENCE runner_id_seq
  INCREMENT BY 1
  START WITH 1
  MAXVALUE 50000
  NOCACHE
  NOCYCLE;
```

ORACLE
Academy

14

Creating a Sequence

- The NOCACHE option prevents values in the SEQUENCE from being cached in memory, which in the event of system failure prevents numbers pre-allocated and held in memory from being lost

```
CREATE SEQUENCE runner_id_seq
  INCREMENT BY 1
  START WITH 1
  MAXVALUE 50000
  NOCACHE
  NOCYCLE;
```

Using the CACHE option gives a slight performance advantage as the numbers are pre-allocated and stored in cache memory. This is quicker to access than with NOCACHE, which calls the next value from the sequence when it is requested.

Creating a Sequence

- The NOCYCLE option prevents the numbering from starting over at 1 if the value 50,000 is exceeded
- Don't use the CYCLE option if the sequence is used to generate primary-key values unless there is a reliable mechanism that deletes old rows faster than new ones are added

```
CREATE SEQUENCE runner_id_seq
  INCREMENT BY 1
  START WITH 1
  MAXVALUE 50000
  NOCACHE
  NOCYCLE;
```

ORACLE
Academy

DP 16-1
Working With Sequences

16

Confirming Sequences

- To verify that a sequence was created, query the USER_OBJECTS data dictionary
- To see all of the SEQUENCE settings, query the USER_SEQUENCES data dictionary as shown below
- List the value names in the SELECT statement as shown below

```
SELECT sequence_name, min_value, max_value, increment_by,
last_number
FROM user_sequences;
```

17

Confirming Sequences

- If NOCACHE is specified, the last_number column in the query displays the next available sequence number
- If CACHE is specified, the last_number column displays the next available number in the sequence which has not been cached into memory

```
SELECT sequence_name, min_value, max_value, increment_by,
last_number
FROM user_sequences;
```

NEXTVAL and CURRVAL Pseudocolumns

- The NEXTVAL pseudocolumn is used to extract successive sequence numbers from a specified sequence

- You must qualify NEXTVAL with the sequence name

- When you reference sequence.NEXTVAL, a new sequence number is generated and the current sequence number is placed in CURRVAL

ORACLE
Academy

19

NEXTVAL and CURRVAL Pseudocolumns

- The example below inserts a new department in the DEPARTMENTS table
- It uses the DEPARTMENTS_SEQ sequence for generating a new department number as follows:

```
INSERT INTO departments
        (department_id, department_name, location_id)
VALUES  (departments_seq.NEXTVAL, 'Support', 2500);
```

NEXTVAL and CURRVAL Pseudocolumns

- Suppose now you want to hire employees to staff the new department

- The INSERT statement to be executed for all new employees can include the following code:

```
INSERT INTO employees
       (employee_id, department_id, ...)
VALUES (employees_seq.NEXTVAL, dept_deptid_seq .CURRVAL,
...);
```

- Note: The preceding example assumes that a sequence called EMPLOYEES_SEQ has already been created for generating new employee numbers

DP 16-1
Working With Sequences

21

NEXTVAL and CURRVAL Pseudocolumns

- The CURRVAL pseudocolumn in the example below is used to refer to a sequence number that the current user has just generated

- NEXTVAL must be used to generate a sequence number in the current user's session before CURRVAL can be referenced

- You must qualify CURRVAL with the sequence name

ORACLE
Academy

22

NEXTVAL and CURRVAL Pseudocolumns

- When sequence.CURRVAL is referenced, the last value generated by that user's process is returned

```
INSERT INTO employees
       (employee_id, department_id, ...)
VALUES (employees_seq.NEXTVAL, dept_deptid_seq.CURRVAL, ...);
```

Using a Sequence

- After you create a sequence, it generates sequential numbers for use in your tables. Reference the sequence values by using the NEXTVAL and CURRVAL pseudocolumns

- You can use NEXTVAL and CURRVAL in the following contexts:
  - The SELECT list of a SELECT statement that is not part of a subquery
  - The SELECT list of a subquery in an INSERT statement
  - The VALUES clause of an INSERT statement
  - The SET clause of an UPDATE statement

ORACLE
Academy

24

Using a Sequence

- You cannot use NEXTVAL and CURRVAL in the following contexts:
  - The SELECT list of a view
  - A SELECT statement with the DISTINCT keyword
  - A SELECT statement with GROUP BY, HAVING, or ORDER BY clauses
  - A subquery in a SELECT, DELETE, or UPDATE statement
  - The DEFAULT expression in a CREATE TABLE or ALTER TABLE statement

ORACLE
Academy

DP 16-1
Working With Sequences

25

Using a Sequence

- To continue our London Marathon example, a table was created for the runners:

```
CREATE TABLE runners
(runner_id NUMBER(6,0) CONSTRAINT runners_id_pk PRIMARY KEY,
 first_name VARCHAR2(30),
 last_name VARCHAR2(30));
```

Using a Sequence

- We then create the sequence that will generate values for the runner_id primary key column

```
CREATE SEQUENCE runner_id_seq
   INCREMENT BY 1
   START WITH 1
   MAXVALUE 50000
   NOCACHE
   NOCYCLE;
```

ORACLE
Academy

DP 16-1
Working With Sequences

Using a Sequence

- Using the following syntax would allow new participants to be inserted into the runners table
- The runner's identification number would be generated by retrieving the NEXTVAL from the sequence

```
INSERT INTO runners
       (runner_id, first_name, last_name)
VALUES (runner_id_seq.NEXTVAL, 'Joanne', 'Everely');
```

```
INSERT INTO runners
       (runner_id, first_name, last_name)
VALUES (runner_id_seq.NEXTVAL, 'Adam', 'Curtis');
```

ORACLE
Academy

28

Using a Sequence

- To confirm the sequence worked correctly, we query the table:

```
SELECT runner_id, first_name, last_name
FROM runners;
```

RUNNER_ID	FIRST_NAME	LAST_NAME
1	Joanne	Everely
2	Adam	Curtis

ORACLE
Academy

29

Using a Sequence

- To view the current value for the runners_id_seq, CURRVAL is used
- Note the use of the DUAL table in this example
- Oracle Application Express will not execute this query, but you should understand how this works

```
SELECT runner_id_seq.CURRVAL
FROM dual;
```

Once you retrieve the NEXTVAL from the sequence, you no longer have a "session" and APEX no longer knows what's in CURRVAL. If a statement attempts to retrieve CURRVAL, a report error is generated: ORA-08002: sequence SEQ_D_SONGS_SQ.CURRVAL is not yet defined in this session.

Using a Sequence

- Cache sequences in memory provide faster access to sequence values
- The cache is populated the first time you refer to the sequence
- Each request for the next sequence value is retrieved from the cached sequence
- After the last sequence value is used, the next request for the sequence pulls another cache of sequences into memory
- 20 is the default number of sequence numbers cached

ORACLE
Academy

DP 16-1
Working With Sequences

31

Nonsequential Numbers

- Although sequence generators issue sequential numbers without gaps, this action occurs independently of a database commit or rollback
- Gaps (nonsequential numbers) can be generated by:
  - Rolling back a statement containing a sequence, the number is lost
  - A system crash. If the sequence caches values into the memory and the system crashes, those values are lost
  - The same sequence being used for multiple tables. If you do so, each table can contain gaps in the sequential numbers

ORACLE
Academy

DP 16-1
Working With Sequences

32

COMMIT and ROLLBACK will be discussed in more detail later in the course.

Viewing the Next Value

- If the sequence was created with NOCACHE, it is possible to view the next available sequence value without incrementing it by querying the USER_SEQUENCES table

```
SELECT sequence_name, min_value, max_value, last_number AS
"Next number"
FROM USER_SEQUENCES
WHERE sequence_name = 'RUNNER_ID_SEQ';
```

SEQUENCE_NAME	MIN_VALUE	MAX_VALUE	Next number
RUNNER_ID_SEQ	1	50000	3

ORACLE
Academy

DP 16-1
Working With Sequences

33

Modifying a Sequence

- As with the other database objects you've created, a SEQUENCE can also be changed using the ALTER SEQUENCE statement

- What if the London Marathon exceeded the 50,000 runner registrations and you needed to add more numbers?

- The sequence could be changed to increase the MAXVALUE without changing the existing number order

```
ALTER SEQUENCE runner_id_seq
                INCREMENT BY 1
                MAXVALUE 999999
                NOCACHE
                NOCYCLE;
```

ORACLE
Academy

DP 16-1
Working With Sequences

34

Modifying a Sequence

- Some validation is performed when you alter a sequence
- For example, a new MAXVALUE that is less than the current sequence number cannot be executed

```
ALTER SEQUENCE runner_id_seq
               INCREMENT BY 1
               MAXVALUE 90
               NOCACHE
               NOCYCLE;

ERROR at line 1:
ORA-04009: MAXVALUE cannot be made to be less than the current
value
```

ORACLE
Academy

ALTER SEQUENCE Guidelines

- A few guidelines apply when executing an ALTER SEQUENCE statement
- They are:
  - You must be the owner or have the ALTER privilege for the sequence in order to modify it
  - Only future sequence numbers are affected by the ALTER SEQUENCE statement
  - The START WITH option cannot be changed using ALTER SEQUENCE. The sequence must be dropped and re-created in order to restart the sequence at a different number

Removing a Sequence

- To remove a sequence from the data dictionary, use the DROP SEQUENCE statement
- You must be the owner of the sequence or have DROP ANY SEQUENCE privileges to remove it
- Once removed, the sequence can no longer be referenced

```
DROP SEQUENCE runner_id_seq;
```

ORACLE
Academy

37

Terminology

- Key terms used in this lesson included:
  - CACHE/ NOCACHE
  - CREATE SEQUENCE
  - CURRVAL
  - CYCLE/ NOCYCLE
  - INCREMENT BY
  - MAXVALUE
  - MINVALUE

DP 16-1
Working With Sequences

38

Terminology

- Key terms used in this lesson included:
  - NEXTVAL
  - NOMAXVALUE
  - NOMINVALUE
  - Sequences
  - START WITH

Summary

- In this lesson, you should have learned how to:
  - List at least three useful characteristics of a sequence
  - Write and execute a SQL statement that creates a sequence
  - Query the data dictionary using USER_SEQUENCES to confirm a sequence definition
  - Apply the rules for using NEXTVAL to generate sequential unique numbers in a table
  - List the advantages and disadvantages of caching sequence values
  - Name three reasons why gaps can occur in a sequence
